

TITLE
TRIACYLGLYCEROL LIPASES
ABSTRACT OF THE DISCLOSURE

This invention relates to an isolated nucleic acid fragment encoding a triacylglycerol
5 lipase. The invention also relates to the construction of a chimeric gene encoding all or a
portion of the triacylglycerol lipase, in sense or antisense orientation, wherein expression of
the chimeric gene results in production of altered levels of the triacylglycerol lipase in a
transformed host cell.
